

# Arvizio Debuts Collaboration Suite for HoloLens Users

Ontario-based software vendor Arvizio has announced an update to [MR Studio, its flagship product for enterprise mixed-reality](#). Previously, the application offered visualisation of complex 3D models ([including point clouds from your DotProduct](#)), real-time collaboration, and enterprise data integration for Microsoft HoloLens. Now, multiple users in different locations can view and interact with life-size 3D holographic models in AR.

The update to MR Studio brings three new modes:

- **HoloSync:** users in the same location walk around the same 1:1 model, each with their own vantage. These users can share annotations and highlight areas of interest.
- **Multi-Room:** Users in multiple locations view and walk through shared models, with avatars representing the location of remote users. The mode also includes audio bridging and annotation features.
- **Remote:** Offers users the option of using a HoloLens or even a laptop to see the real-time video feed from a selected headset. These users can participate with audio, video, text chat, and annotation.

For more information, [see Arvizio's website](#).
